

Ratio and Proportion

(Including Properties and Uses)

7.1 Introduction :

Basic concepts of ratio and proportion have already been studied in earlier classes, especially in classes 8 and 9. In this chapter of Class 10, we shall study ratio and proportion in more detail.

7.2 Ratio :

The ratio of two quantities of the same kind and in the same units is a comparison obtained by dividing the first quantity by the other.

If a and b are two quantities of the same kind and with the same units such that

 $b \neq 0$; then the quotient $\frac{a}{b}$ is called the **ratio** between a and b.

Remember :

1

- 1. Ratio $\frac{a}{b}$ has no unit and can be written as a : b (read as a is to b).
- 2. The quantities a and b are called terms of the ratio. The first quantity a is called the *first* term or the antecedent and the second quantity b is called the second term or the consequent of the ratio a : b.

The second term of a ratio cannot be zero.

- *i.e.* (i) In the ratio a : b, the second term **b** cannot be zero $(b \neq 0)$.
 - (ii) In the ratio b: a, the second term $a \neq 0$.
- 3. If both the terms of a ratio are multiplied or divided by the same non-zero number, the ratio remains unchanged.
- 4. A *ratio must* always be expressed in its *lowest terms i.e.* both the terms of the ratio must be co-prime.

The ratio is in its lowest terms, if the H.C.F. of its both the terms is 1 (unity).

- e.g. (i) The ratio 3: 7 is in its lowest terms as the H.C.F. of its terms 3 and 7 is 1.
 - (ii) The ratio 4 : 20 is not in its lowest terms as the H.C.F. of its terms 4 and 20 is 4 and not 1.
- 5. Ratios a: b and b: a cannot be equal unless a = b

i.e., $a: b \neq b: a$, unless a = b.

In other words, the order of the terms in a ratio is important.

(i) If 2x + 3y : 3x + 5y = 18 : 29, find x : y.

(ii) If x : y = 2 : 3, find the value of 3x + 2y : 2x + 5y.

Solution : (i) 2x + 3y : 3x + 5y = 18 : 29 $\frac{2x+3y}{3x+5y} = \frac{18}{29}$ => 58x + 87y = 54x + 90y \Rightarrow 4x = 3y \Rightarrow $\frac{x}{y} = \frac{3}{4}$ *i.e.* x : y = 3 : 4= Ans. (ii) $x: y = 2: 3 \Rightarrow \frac{x}{y} = \frac{2}{3}$ Now, $3x + 2y : 2x + 5y = \frac{3x + 2y}{2x + 5y}$ $= \frac{3\left(\frac{x}{y}\right)+2}{2\left(\frac{x}{y}\right)+5}$ [Dividing each term by y] $= \frac{3 \times \frac{2}{3} + 2}{2 \times \frac{2}{3} + 5}$ $\left[\because \frac{x}{y} = \frac{2}{3} \right]$ = 12 : 19Ans.

Alternative method :

 $\Rightarrow x : y = 2 : 3 \Rightarrow 3x = 2y \Rightarrow x = \frac{2y}{3}$ $\therefore \frac{3x + 2y}{2x + 5y} = \frac{3 \times \frac{2y}{3} + 2y}{2 \times \frac{2y}{3} + 5y} = \frac{4y}{\frac{19y}{3}} = \frac{4 \times 3}{19} = 12 : 19$ OR, $x : y = 2 : 3 \Rightarrow 3x = 2y \Rightarrow y = \frac{3x}{2}$ $\therefore \frac{3x + 2y}{2x + 5y} = \frac{3x + 2 \times \frac{3x}{2}}{2} = \frac{6x}{2} = \frac{6 \times 2}{2} = 12 \times 10$

$$\therefore \frac{3x+2y}{2x+5y} = \frac{3x+2\times\frac{1}{2}}{2x+5\times\frac{3x}{2}} = \frac{6x}{\frac{19x}{2}} = \frac{6\times2}{19} = 12:19$$
 Ans.

3rd Method :

1

 $x: y = 2: 3 \implies \text{if } x = 2k \text{ then } y = 3k$

And,
$$\frac{3x+2y}{2x+5y} = \frac{3\times 2k+2\times 3k}{2\times 2k+5\times 3k} = \frac{12k}{19k} = \frac{12}{19} = 12:19$$
 Ans.

Precaution :

For
$$x : y = 2 : 3$$
; if we take $x = 2$ and $y = 3$; then

$$\frac{3x + 2y}{2x + 5y} = \frac{3 \times 2 + 2 \times 3}{2 \times 2 + 5 \times 3}$$

 $=\frac{12}{19}=12:19$; which is the same as obtained in each solution given above.

But this solution is absolutely wrong and for this solution, a student will score no marks. **Reason**: Let the age of Mohit = 15 yrs. and the age of his elder brother Rahul = 24 yrs. The ratio between the ages of Mohit and Rahul = 15 yrs : 24 yrs = 5 : 8. Now read it otherwise, that the ratio between the ages of Mohit and Rahul is 5 : 8. What does it mean ? Does it mean that Mohit's age is 5 years and Rahul's age is 8 years. The answer is simple, *i.e.* No.

In the same way, if x : y = 2 : 3, it does not mean x = 2 and y = 3.

If
$$a : b = 5 : 3$$
, find $(5a + 8b) : (6a - 7b)$.

[2002]

Solution :

2

Let
$$a: b = 5: 3 \implies \text{if } a = 5x$$
, then $b = 3x$;

and

$$\frac{5a+8b}{6a-7b} = \frac{5\times5x+8\times3x}{6\times5x-7\times3x} = \frac{49x}{9x} = 49:9$$
 Ans.

10x + 16 = 9x + 24

Two numbers are in the ratio 3 : 5. If 8 is added to each number, the ratio becomes 2 : 3. Find the numbers.

Solution :

3

Since, the ratio between the numbers is 3 : 5

 $\frac{3x+8}{5x+8} = \frac{2}{3}$

 \Rightarrow if one number is 3x; the other number is 5x

Given :

 $\Rightarrow x = 8$

 \therefore Nos. are 3x and 5x = 3 × 8 and 5 × 8 = 24 and 40

(i) What quantity must be added to each term of the ratio 8 : 15 so that it becomes equal to 3 : 5 ?

(ii) What quantity must be subtracted from each term of the ratio a : b so that it becomes c : d?

Solution :

4

(i) Let x be added to each term of the ratio 8: 15.

Given :
$$\frac{8+x}{15+x} = \frac{3}{5}$$

 $\Rightarrow \quad 40+5x = 45+3x \quad \Rightarrow \quad x = 2\frac{1}{2}$
79

Ans.

Ans.

(ii) Let x be subtracted, then :

 $\frac{a-x}{b-x} = \frac{c}{d}$ $\Rightarrow \quad ad - dx = bc - cx$ $\Rightarrow \quad cx - dx = bc - ad$

 $x(c-d) = bc - ad \implies x = \frac{bc - ad}{dc}$

The work done by (x - 3) men in (2x + 1) days and the work done by (2x + 1) men in (x + 4) days are in the ratio 3 : 10. Find the value of x. [2003]

Ans.

Ans.

Solution :

 \Rightarrow

5

Assuming that all the men do the same amount of work in one day and one day work of each man = 1 unit; we get :

Amount of work done by (x - 3) men in (2x + 1) days

= amount of work done by (x - 3) (2x + 1) men in one day

= (x - 3) (2x + 1) units of work.

Similarly, amount of work done by (2x + 1) men in (x + 4) days.

- = amount of work done by (2x + 1)(x + 4) men in one day.
- = (2x + 1) (x + 4) units of work.

According to the given statement :

 $\frac{(x-3)(2x+1)}{(2x+1)(x+4)} = \frac{3}{10}$ $\Rightarrow \frac{2x^2 + x - 6x - 3}{2x^2 + 8x + x + 4} = \frac{3}{10} \quad i.e. \quad \frac{2x^2 - 5x - 3}{2x^2 + 9x + 4} = \frac{3}{10}$ $\Rightarrow 20x^2 - 50x - 30 = 6x^2 + 27x + 12$ $\Rightarrow 14x^2 - 77x - 42 = 0$ $\Rightarrow 2x^2 - 11x - 6 = 0$ $\Rightarrow (x - 6)(2x + 1) = 0 \qquad [On factorising]$ $\Rightarrow x = 6, \text{ or } x = -\frac{1}{2}$

 $x = -\frac{1}{2}$ is not possible as it will make no. of men (x - 3) negative.

$$x = 0$$

7.3 Increase (or decrease) in a ratio :

1. Let the price of an article increases from ₹ 20 to ₹ 24; we say that the price has increased in the ratio 20 : 24 = 5 : 6.

 \Rightarrow The original price of the article : Its increased price = 5 : 6

2. Let the price of an article decreases from ₹ 24 to ₹ 20; we say that the price has decreased in the ratio 24 : 20 = 6 : 5.

 \Rightarrow The original price of the article : Its decreased price = 6 : 5

In general :

If a quantity increases or decreases in the ratio a : b.

 \Rightarrow The new (resulting) quantity = $\frac{b}{a}$ times of the original quantity.

6 When the fare of a certain journey by an airliner was increased in the ratio 5 : 7 the cost of the ticket for the journey became ₹ 1,421. Find the increase in the fare.

Solution :

According to the given statement :

The o	riginal fair : Increased fair = $5:7$	
\Rightarrow	$7 \times$ The original fare = $5 \times$ Increased fair	
\Rightarrow	7 × The original fare = 5 × ₹ 1,421	
⇒	The original fare = $\frac{5 \times \overline{1,421}}{7} = \overline{1,015}$	
	Increase in the fare = ₹ (1,421 – 1,015) = ₹ 406	Ans.

In a regiment, the ratio of number of officers to the number of soldiers was 3:31 before a battle. In the battle 6 officers and 22 soldiers were killed. The ratio between the number of officers and the number of soldiers now is 1:13. Find the number of officers and soldiers in the regiment before the battle. [1992]

Solution :

7

Before the battle :

Let the number of officers be 3x

```
\Rightarrow the number of soldiers = 31x
```

After the battle :

The number of officers = 3x - 6

and, the number of soldiers = 31x - 22

Given : $\frac{3x-6}{31x-22} = \frac{1}{13} \Rightarrow x = 7$

[On solving]

Ans.

:. The no. of officers before battle = $3x = 3 \times 7 = 21$

and the no. of soldiers before battle = $31x = 31 \times 7 = 217$

Solution :

Since,

 $a+b+c=0 \implies a+b=-c,$ b+c=-a and c+a=-b

$$\frac{a}{b+c} = \frac{a}{-a} = -1; \ \frac{b}{c+a} = \frac{b}{-b} = -1 \text{ and } \frac{c}{a+b} = \frac{c}{-c} = -1$$

Ans.

Hence, each of the given ratios is -1.

9 If
$$\frac{a}{b+c} = \frac{b}{c+a} = \frac{c}{a+b}$$
 and $a + b + c \neq 0$; show that each given ratio is equal to $\frac{1}{2}$.

Solution :

...

11

For any two or more equal ratios, each ratio is equal to the ratio between sum of their antecedents and sum of their consequents.

∴ (i)	$\frac{a}{b} = \frac{c}{d}$	⇒	$\frac{a}{b} = \frac{c}{d} = \frac{a+c}{b+d}$
(ii)	$\frac{a}{b} = \frac{c}{d} = \frac{e}{f}$	⇒	$\frac{a}{b} = \frac{c}{d} = \frac{e}{f} = \frac{a+c+e}{b+d+f}$ and so on.
Given :	$\frac{a}{b+c} = \frac{b}{c+a}$	$=\frac{c}{a+b}$	
⇒	$\frac{a}{b+c} = \frac{b}{c+a}$	$=\frac{c}{a+b}$	$= \frac{\text{sum of antecedents}}{\text{sum of consequents}}$ $a+b+c$
		:	$= \overline{(b+c)+(c+a)+(a+b)}$
			$= \frac{a+b+c}{2a+2b+2c} = \frac{a+b+c}{2(a+b+c)}$
			$=$ $\frac{1}{2}$ Ans

7.4 Commensurable and incommensurable quantities :

If the ratio between any two quantities of the same kind and having the same unit can be expressed exactly by the ratio between two integers; the quantities are said to be *commensurable*; otherwise *incommensurable*,

e.g. (i) The ratio between $2\frac{1}{3}$ and $3\frac{1}{2}$ = $\frac{7}{3}: \frac{7}{2} = \frac{7}{3} \times \frac{2}{7} = 2:3$; which is the ratio between two integers 2 and 3. Therefore, $2\frac{1}{3}$ and $3\frac{1}{2}$ are commensurable quantities.

(ii) The ratio between $\sqrt{3}$ and 5 is $\sqrt{3}$: 5; which can never be expressed as the ratio between two integers; therefore $\sqrt{3}$ and 5 are *incommensurable quantities*.

7.5 Composition of Ratios :

(i) Compound Ratio :

For two or more ratios, the ratio between the product of their antecedents to the product of their consequents is called *compound ratio*.

e.g., For ratios a : b and c : d; the compound ratio is $(a \times c) : (b \times d)$. For ratios a : b, c : d and e : f; the compound ratio is $(a \times c \times e) : (b \times d \times f)$ and so on.

(ii) Duplicate Ratio :

It is the compound ratio of two equal ratios.

e.g., Duplicate ratio of a : b = Compound ratio of a : b and a : b= $(a \times a) : (b \times b) = a^2 : b^2$ Thus, duplicate ratio of 2 : 3 = $2^2 : 3^2$ = 4 : 9

(iii) Triplicate Ratio :

It is the compound ratio of three equal ratios.

e.g., Triplicate ratio of a : b = Compound ratio of a : b, a : b and a : b= $(a \times a \times a) : (b \times b \times b) = a^3 : b^3$ Thus, triplicate ratio of 2 : 3 = $2^3 : 3^3$ = 8 : 27

(iv) Sub-duplicate Ratio :

For any ratio a: b, its sub-duplicate ratio is $\sqrt{a}: \sqrt{b}$

Thus, sub-duplicate ratio of 9 : $16 = \sqrt{9} : \sqrt{16}$ = 3 : 4.

(v) Sub-triplicate Ratio :

For any ratio a: b, its sub-triplicate ratio is $\sqrt[3]{a}: \sqrt[3]{b}$

Thus, sub-triplicate ratio of 27 : $64 = \sqrt[3]{27} : \sqrt[3]{64}$

(vi) Reciprocal Ratio :

For any ratio a : b; where $a, b \neq 0$, its reciprocal ratio $= \frac{1}{a} : \frac{1}{b} = b : a$. Thus, reciprocal ratio of $3 : 5 = \frac{1}{3} : \frac{1}{5} = 5 : 3$.

83

Find the compound ratio of :
(i) 3a : 2b, 2m : n and 4x : 3y
(ii) a - b : a + b, (a + b)² : a² + b² and a⁴ - b⁴ : (a² - b²)².

Solution :

(i) **Required compound ratio** = $(3a \times 2m \times 4x) : (2b \times n \times 3y)$

$$=\frac{24\ amx}{6\ bn\ y}=4\ amx\ :\ bny$$
 Ans.

(ii) **Required compound ratio** = $[(a-b) . (a+b)^2 . (a^4-b^4)] : [(a+b) . (a^2+b^2) . (a^2-b^2)^2]$

$$=\frac{(a-b)(a+b)^2(a^2+b^2)(a^2-b^2)}{(a+b)(a^2+b^2)(a^2-b^2)(a+b)(a-b)}$$

=1:1

Find the ratio compounded of the duplicate ratio of 5 : 6, the reciprocal ratio of 25 : 42 and the sub-triplicate ratio of 216 : 343.

Solution :

Since, duplicate ratio of 5 : 6 = 5² : 6² = 25 : 36, reciprocal ratio of 25 : 42 = $\frac{1}{25}$: $\frac{1}{42}$ = 42 : 25

and, sub-triplicate ratio of 216 : $343 = \sqrt[3]{216}$: $\sqrt[3]{343} = 6$: 7.

Therefore, the required compounded ratio = $(25 \times 42 \times 6)$: $(36 \times 25 \times 7)$

 $= \frac{25 \times 42 \times 6}{36 \times 25 \times 7} = 1 : 1$ Ans.

Ans.

EXERCISE 7(A)

1. If a: b = 5: 3, find $: \frac{5a - 3b}{5a + 3b}$.

- 2. If x : y = 4 : 7, find the value of (3x + 2y) : (5x + y).
- 3. If a : b = 3 : 8, find the value of $\frac{4a + 3b}{6a b}$.
- 4. If (a b) : (a + b) = 1 : 11, find the ratio (5a + 4b + 15) : (5a 4b + 3).
- 5. Find the number which bears the same ratio
 - to $\frac{7}{33}$ that $\frac{8}{21}$ does to $\frac{4}{9}$.
- 6. If $\frac{m+n}{m+3n} = \frac{2}{3}$, find : $\frac{2n^2}{3m^2+mn}$.
- 7. Find $\frac{x}{y}$; when $x^2 + 6y^2 = 5xy$.
- 8. If the ratio between 8 and 11 is the same as the ratio of 2x y to x + 2y, find the value of $\frac{7x}{9y}$.
- 9. Divide ₹ 1,290 into A, B and C such that A is $\frac{2}{5}$ of B and B : C = 4 : 3.

- 10. A school has 630 students. The ratio of the number of boys to the number of girls is 3 : 2. This ratio changes to 7 : 5 after the admission of 90 new students. Find the number of newly admitted boys.
- 11. What quantity must be subtracted from each term of the ratio 9 : 17 to make it equal to 1 : 3?
- The monthly pocket money of Ravi and Sanjeev are in the ratio 5 : 7. Their expenditures are in the ratio 3 : 5. If each saves ₹ 80 every month, find their monthly pocket money. [2012]
- 13. The work done by (x 2) men in (4x + 1) days and the work done by (4x + 1) men in (2x - 3) days are in the ratio 3 : 8. Find the value of x.
- 14. The bus fare between two cities is increased in the ratio 7 : 9. Find the increase in the fare, if :
 - (i) the original fare is \gtrless 245;
 - (ii) the increased fare is ₹ 207.
- 15. By increasing the cost of entry ticket to a fair in the ratio 10: 13, the number of visitors to the fair has decreased in the ratio 6: 5. In

what ratio has the total collection increased or decreased ?

- 16. In a basket, the ratio between the number of oranges and the number of apples is 7 : 13. If 8 oranges and 11 apples are eaten, the ratio between the number of oranges and the number of apples becomes 1 : 2. Find the original number of oranges and the original number of apples in the basket.
- 17. In a mixture of 126 kg of milk and water, milk and water are in ratio 5 : 2. How much water must be added to the mixture to make this ratio 3 : 2 ?
- 18. (a) If A : B = 3 : 4 and B : C = 6 : 7, find :
 (i) A : B : C
 (ii) A : C
 - (b) If A : B = 2 : 5 and A : C = 3 : 4, find : A : B : C.
- 19. (i) If 3A = 4B = 6C; find : A : B : C. (ii) If 2a = 3b and 4b = 5c, find : a : c.

20. Find the compound ratio of :

- (i) 2:3,9:14 and 14:27.
- (ii) $2a: 3b, mn: x^2$ and x: n.
- (iii) $\sqrt{2}$: 1, 3: $\sqrt{5}$ and $\sqrt{20}$: 9.

- 21. Find duplicate ratio of :
 - (i) 3:4 (ii) $3\sqrt{3}:2\sqrt{5}$
- 22. Find triplicate ratio of :
 - (i) 1:3 (ii) $\frac{m}{2}:\frac{n}{3}$
- 23. Find sub-duplicate ratio of :

 (i) 9:16
 (ii) (x y)⁴: (x + y)⁶

 24. Find sub-triplicate ratio of :
 - (i) 64:27 (ii) $x^3:125y^3$
- 25. Find the reciprocal ratio of :

(i) 5:8 (ii) $\frac{x}{3}:\frac{y}{7}$

- 26. If (x + 3): (4x + 1) is the duplicate ratio of 3: 5, find the value of x.
- 27. If m : n is the duplicate ratio of m + x : n + x; show that : $x^2 = mn$.
- 28. If (3x 9) : (5x + 4) is the triplicate ratio of 3 : 4, find the value of x.
- 29. Find the ratio compounded of the reciprocal ratio of 15:28, the sub-duplicate ratio of 36:49 and the triplicate ratio of 5:4.
- 30. (a) If $r^2 = pq$, show that p : q is the duplicate ratio of (p + r) : (q + r).
 - (b) If (p x) : (q x) be the duplicate ratio of p : q then show that $: \frac{1}{p} + \frac{1}{q} = \frac{1}{x}$.

7.6 Proportion :

Four non-zero quantities, a, b, c and d are said to be in proportion (or, are proportional), if a : b = c : d.

This is often expressed as a : b :: c : d and is read as "a is to b as c is to d".

1. In a : b = c : d,

- (i) a, b, c and d are called the terms of the proportion; where a = first term, b = second term, c = third term and d = fourth term.
- (ii) 'a' and 'd' are called *extremes* (end-terms) whereas 'b' and 'c' are called *means* (middle terms).

2.
$$a: b = c: d \implies \frac{a}{b} = \frac{c}{d} \implies a \times d = b \times c$$

 \Rightarrow product of extremes = product of means.

- 3. In a: b = c: d, the fourth term 'd' is called the *fourth proportional*.
- 4. In a: b = c: d, quantities a and b must be of the same kind with the same units, whereas; c and d may separately be of the same kind with the same units.

e.g. 5kg : 15 kg = ₹ 75 : ₹ 225

7.7 Continued proportion :

Three non-zero quantities of the same kind and in the same unit are said to be in **continued proportion**, if the ratio of the first to the second is the same as the ratio of the second to the third.

Thus, a, b and c are in the continued proportion if a : b = b : c.

In general, the non-zero quantities a, b, c, d, e, etc. (all of the same kind and in the same unit) are in continued proportion $\Leftrightarrow \frac{a}{b} = \frac{b}{c} = \frac{c}{d} = \frac{d}{e}$

a, b and c are in continued proportion

 $\Leftrightarrow a:b=b:c,$

Here, the second quantity i.e. 'b' is called the mean proportional between 'a' and 'c'; whereas the third quantity i.e. 'c' is called the third proportional to 'a' and 'b'.

2 Find : (i) the fourth proportional to 3, 6 and 4.5.

- (ii) the mean proportional between 6.25 and 0.16.
- (iii) the third proportional to 1.2 and 1.8.

Solution :

1

- (i) Let the fourth proportional to 3, 6 and 4.5 be x.
 - \Rightarrow 3:6 = 4.5:x
 - $\Rightarrow 3 \times x = 6 \times 4.5 \qquad \Rightarrow \qquad x = 9$
- (ii) Let the mean proportional between 6.25 and 0.16 be x.

 \Rightarrow 6.25, x and 0.16 are in continued proportion.

- $\Rightarrow 6.25 : x = x : 0.16$
- $\Rightarrow x \times x = 6.25 \times 0.16 \Rightarrow x^2 = 1 \Rightarrow x = 1$ Ans.

Ans.

(iii) Let the third proportional to 1.2 and 1.8 be x

 \Rightarrow 1.2, 1.8 and x are in continued proportion.

$$\Rightarrow 1.2: 1.8 = 1.8: x \qquad \Rightarrow \qquad x = \frac{1.8 \times 1.8}{1.2} = 2.7 \qquad \text{Ans.}$$

Quantities a, 2, 10 and b are in continued proportion; find the values of a and b.

Solution :

a, 2, 10 and b are in continued proportion

$$\Rightarrow \qquad \frac{a}{2} = \frac{2}{10} = \frac{10}{b} \qquad \Rightarrow \qquad \frac{a}{2} = \frac{2}{10} \text{ and } \frac{2}{10} = \frac{10}{b}$$
$$\Rightarrow \qquad a = 0.4 \text{ and } b = 50 \qquad \text{Ans.}$$

4 What number should be subtracted from each of the numbers 23, 30, 57 and 78; so that the remainders are in proportion ? [2004]

Solution :

Let the number subtracted be x.

$$(23 - x) : (30 - x) : (57 - x) : (78 - x)$$

$$\frac{23-x}{30-x} = \frac{57-x}{78-x}$$

 $1794 - 101x + x^2 = 1710 - 87x + x^2 \implies 14x = 84$ and x = 6Ans. -

15 What should be added to each of the numbers 13, 17 and 22 so that the resulting numbers are in continued proportion ?

Solution :

Let the required number to be added is x.

 \therefore 13 + x, 17 + x and 22 + x are in continued proportion.

=

⇒

 $\frac{13+x}{17+x} = \frac{17+x}{22+x}$ *i.e.* $(13 + x)(22 + x) = (17 + x)^2$ $286 + 35x + x^2 = 289 + 34x + x^2$ i.e. x = 3 \therefore Required number = 3 Ans.

16 If $(a^2 + c^2)$, (ab + cd) and $(b^2 + d^2)$ are in continued proportion; prove that a, b, c and d are in proportion.

Solution :

Given, $(a^2 + c^2)$, (ab + cd) and $(b^2 + d^2)$ are in continued proportion.

 $\frac{a^2+c^2}{ab+cd} = \frac{ab+cd}{b^2+d^2}$ $\Rightarrow (a^2 + c^2) (b^2 + d^2) = (ab + cd)^2$... *i.e.* $a^{2}b^{2} + a^{2}d^{2} + b^{2}c^{2} + c^{2}d^{2} = a^{2}b^{2} + 2abcd + c^{2}d^{2}$ $a^2d^2 + b^2c^2 - 2abcd = 0$ $i.e. \qquad (ad-bc)^2=0$ \Rightarrow i.e. ad - bc = 0ad = bc⇒ $\frac{a}{b} = \frac{c}{d}$ *i.e. a, b, c and d are in proportion* \Rightarrow

Hence Proved.

If p:q::q:r, prove that $p:r = p^2:q^2$. 17

Solution :

 $p:q::q:r \Rightarrow q^2 = pr$

$$\therefore p^{2}: q^{2} = \frac{p^{2}}{q^{2}} = \frac{p^{2}}{pr}$$

$$= \frac{p}{r} = p: r.$$
Hence Proved

18 If $a \neq b$ and a : b is the duplicate ratio of a + c and b + c, prove that 'c' is the mean proportional between 'a' and 'b'.

Solution :

1

'c' will be mean proportional between 'a' and 'b', if a : c = c : b i.e., if $c^2 = ab$.

Given : $\frac{a}{b} = \frac{(a+c)^2}{(b+c)^2}$ $\Rightarrow \quad a(b^2 + c^2 + 2bc) = b(a^2 + c^2 + 2ac)$ $\Rightarrow \quad ab^2 + ac^2 + 2abc = a^2b + bc^2 + 2abc$ $\Rightarrow \quad ac^2 - bc^2 = a^2b - ab^2$ $\Rightarrow \quad c^2(a-b) = ab(a-b)$ $\Rightarrow \quad c^2 = ab \qquad [As \ a \neq b]$ $\Rightarrow \quad bc' \text{ is mean proportional between (a' and (b))}$

 \Rightarrow 'c' is mean proportional between 'a' and 'b'.

Hence Proved.

19 If a + c = mb and $\frac{1}{b} + \frac{1}{d} = \frac{m}{c}$, prove that a, b, c and d are in proportion.

Solution :

	$\frac{1}{b} + \frac{1}{d} = \frac{m}{c}$	⇒	$\frac{d+b}{bd} =$	$\frac{m}{c}$
i.e.	cd + cb = mbd			
\Rightarrow	cd + bc = (a + c)d			$[\because a + c = mb]$
⇒	cd + bc = ad + cd			
⇒	bc = ad	i.e.	$\frac{a}{b} =$	$\frac{c}{d}$
\Rightarrow	a, b, c and d are in proportion			Hence Proved.

Alternative method :

$$a + c = mb$$
 \Rightarrow $m = \frac{a + c}{b}$

Substituting the value of m in the other given equation, we get :

$$\frac{1}{b} + \frac{1}{d} = \frac{a+c}{bc} \qquad \Rightarrow \qquad \frac{d+b}{bd} = \frac{a+c}{bc}$$
$$\frac{d+b}{d} = \frac{a+c}{c} \qquad \Rightarrow \qquad cd+bc = ad+cd$$

i.e.

i.e. a, b, c and d are in proportion

bc = ad

 $\frac{a}{b} = \frac{c}{d}$ Hence Proved.

20 If q is the mean proportional between p and r, prove that :

$$p^{2} - q^{2} + r^{2} = q^{4} \left(\frac{1}{p^{2}} - \frac{1}{q^{2}} + \frac{1}{r^{2}} \right).$$

 \Rightarrow

Solution :

i.e.

 \therefore q is the mean proportional between p and $r \Rightarrow q^2 = pr$

$$\therefore \quad \mathbf{R.H.S.} = q^4 \left(\frac{1}{p^2} - \frac{1}{q^2} + \frac{1}{r^2} \right)$$

$$= \frac{q^4}{p^2} - q^2 + \frac{q^4}{r^2}$$

$$= \frac{p^2 r^2}{p^2} - q^2 + \frac{p^2 r^2}{r^2}$$

$$= r^2 - q^2 + p^2 = \mathbf{L.H.S.}$$

$$[q^2 = pr \Rightarrow q^4 = p^2 r^2]$$
Hence Proved.

Alternative method ('k' method) :

Step: 1	Put each given ratios equal to k.	
2	Obtain the antecedent of each ratio in terms of k.	
3	Substitute the values, obtained in step 2 in terms of k .	and the state
4	Simplify.	

Given :
$$q$$
 is the mean proportional between p and r

$$\Rightarrow \quad p: q = q: r$$

$$\Rightarrow \quad \frac{p}{q} = \frac{q}{r} = k \text{ (say)} \qquad \Rightarrow \quad \frac{p}{q} = k \text{ and } \frac{q}{r} = k$$
i.e. $p = qk, q = rk$ and $p = qk = (rk)k = rk^2$

$$\therefore \quad \mathbf{R.H.S.} = q^4 \left(\frac{1}{p^2} - \frac{1}{q^2} + \frac{1}{r^2}\right)$$

$$= r^4 k^4 \left(\frac{1}{r^2 k^4} - \frac{1}{r^2 k^2} + \frac{1}{r^2}\right) \qquad [\because q = rk \text{ and } p = rk^2]$$

$$= r^2 - r^2 k^2 + r^2 k^4$$

$$= r^2 - (rk)^2 + (rk^2)^2$$

$$= r^2 - q^2 + p^2 \qquad [\because q = rk \text{ and } p = rk^2]$$

$$= \mathbf{L.H.S.} \qquad \text{Hence Proved.}$$

21 If
$$\frac{a}{b} = \frac{c}{d}$$
, prove that each given ratio $(\frac{a}{b} \text{ and } \frac{c}{d})$ is equal to :
(i) $\frac{3a-5c}{3b-5d}$ (ii) $\sqrt{\frac{2a^2+9c^2}{2b^2+9d^2}}$ (iii) $\left(\frac{5a^3-13c^3}{5b^3-13d^3}\right)^{\frac{1}{3}}$

Solution :

1

Let
$$\frac{a}{b} = \frac{c}{d} = k \implies \frac{a}{b} = k$$
 and $\frac{c}{d} = k \implies a = bk$ and $c = dk$
(i) $\frac{3a-5c}{3b-5d} = \frac{3(bk)-5(dk)}{3b-5d} = \frac{k(3b-5d)}{3b-5d} = k = \text{each given ratio}$

Hence Proved.

(ii)
$$\sqrt{\frac{2a^2 + 9c^2}{2b^2 + 9d^2}} = \sqrt{\frac{2(bk)^2 + 9(dk)^2}{2b^2 + 9d^2}} = \sqrt{\frac{k^2(2b^2 + 9d^2)}{2b^2 + 9d^2}}$$

= $\sqrt{k^2} = k$ = each given ratio

Hence Proved.

(iii)
$$\left(\frac{5a^3 - 13c^3}{5b^3 - 13d^3}\right)^{\frac{1}{3}} = \left[\frac{5(bk)^3 - 13(dk)^3}{5b^3 - 13d^3}\right]^{\frac{1}{3}} = \left[\frac{k^3(5b^3 - 13d^3)}{5b^3 - 13d^3}\right]^{\frac{1}{3}}$$

= $\left[k^3\right]^{\frac{1}{3}} = k$ = each given ratio
Hence Proved.

22 If a, b, c and d are in proportion, prove that : (i) $\frac{a-b}{c-d} = \sqrt{\frac{3a^2+8b^2}{3c^2+8d^2}}$ (ii) $\frac{5a^2 + 12c^2}{5b^2 + 12d^2} = \sqrt{\frac{3a^4 - 7c^4}{3b^4 - 7d^4}}$

Solution :

a, b, c and d are in proportion

$$\Rightarrow \qquad \frac{a}{b} = \frac{c}{d} = k \text{ (let)}$$

(i)

$$\frac{a}{b} = k \text{ and } \frac{c}{d} = k \qquad i.e. \ a = bk \text{ and } c = dk$$
L.H.S. $= \frac{a-b}{c-d} = \frac{bk-b}{dk-d} = \frac{b(k-1)}{d(k-1)} = \frac{b}{d} \qquad \dots I$
R.H.S. $= \sqrt{\frac{3a^2+8b^2}{3c^2+8d^2}} = \sqrt{\frac{3(bk)^2+8b^2}{3(dk)^2+8d^2}}$
 $= \sqrt{\frac{b^2(3k^2+8)}{d^2(3k^2+8)}} = \sqrt{\frac{b^2}{d^2}} = \frac{b}{d} \qquad \dots I$

From equations I and II, we get : L.H.S. = R.H.S.

Hence Proved.

90

(ii)

1

L.H.S. =
$$\frac{5a^2 + 12c^2}{5b^2 + 12d^2}$$
 = $\frac{5(bk)^2 + 12(dk)^2}{5b^2 + 12d^2}$
= $\frac{k^2(5b^2 + 12d^2)}{5b^2 + 12d^2}$ = k^2 I
R.H.S. = $\sqrt{\frac{3a^4 - 7c^4}{3b^4 - 7d^4}}$ = $\sqrt{\frac{3(bk)^4 - 7(dk)^4}{3b^4 - 7d^4}}$
= $\sqrt{\frac{k^4(3b^4 - 7d^4)}{3b^4 - 7d^4}}$ = $\sqrt{k^4}$ = k^2 II

From equations I and II, we get : L.H.S. = R.H.S.

Hence Proved.

23 6 is the mean proportion between two numbers x and y and 48 is third proportion to x and y. Find the numbers. [2011]

Solution :

Since, 6 is mean proportio	nal betw	veen x and y.	
\Rightarrow x:6 = 6:y	\Rightarrow	xy = 36	I
and, 48 is third proportion	al to x a	and y	
$\Rightarrow x: y = y: 48$	\Rightarrow	$y^2 = 48 x$	ш
From eq. (I); $xy = 36$		9	
Substituting $x = \frac{36}{y}$ in e	q. II, we	e get :	
$y^2 = 48 \times \frac{36}{y}$	⇒	$y^3 = 36 \times 48$ and, $y = 12$	
		$x = \frac{36}{y} = \frac{36}{12} = 3$	
: The required nos. are	3 and 1	2.	Ans.

EXERCISE 7(B)

- Find the fourth proportional to :

 (i) 1.5, 4.5 and 3.5
 (ii) 3a, 6a² and 2ab²
- 2. Find the third proportional to :
 - (i) $2\frac{2}{3}$ and 4 (ii) a - b and $a^2 - b^2$
- 3. Find the mean proportional between :
 - (i) $6 + 3\sqrt{3}$ and $8 4\sqrt{3}$
 - (ii) a b and $a^3 a^2 b$.

- 4. If x + 5 is the mean proportion between x + 2 and x + 9; find the value of x.
- 5. If x^2 , 4 and 9 are in continued proprotion, find x.
- 6. What least number must be added to each of the numbers 6, 15, 20 and 43 to make them proportional ? (2005, 2013)
- 7. (i) If a, b, c are in continued proportion,

show that :
$$\frac{a^2 + b^2}{b(a+c)} = \frac{b(a+c)}{b^2 + c^2}$$
.

(ii) If a, b, c are in continued proportion and a(b - c) = 2b, prove that :

(iii) If
$$\frac{a}{b} = \frac{c}{d}$$
, show that :
$$\frac{a^3c + ac^3}{b^3d + bd^3} = \frac{(a+c)^4}{(b+d)^4}$$

- 8. What least number must be subtracted from each of the numbers 7, 17 and 47 so that the remainders are in continued proportion ?
- 9. If y is the mean proportional between x and z; show that xy + yz is the mean proportional between $x^2 + y^2$ and $y^2 + z^2$.
- 10. If q is the mean proportional between p and r, show that :

 $pqr (p + q + r)^{3} = (pq + qr + pr)^{3}.$ q is the mean proportional between p and $r \Rightarrow q^{2} = pr.$ L.H.S. = $pqr (p + q + r)^{3}$ = $q \cdot q^{2} (p + q + r)^{3}$ = $q^{3}(p + q + r)^{3}$ = $[q(p + q + r)]^{3}$ = $(pq + q^{2} + qr)^{3}$ = $(pq + pr + qr)^{3}$ = R.H.S.

11. If three quantities are in continued proportion; show that the ratio of the first to the third is the duplicate ratio of the first to the second.

If the three quantities be x, y and z; then x : y = y : z and to prove that $x : z = x^2 : y^2$

12. If y is the mean proportional between x and

z, prove that : $\frac{x^2 - y^2 + z^2}{x^{-2} - y^{-2} + z^{-2}} = y^4$.

13. Given four quantities a, b, c and d are in proportion. Show that :

 $(a - c) b^2 : (b - d) cd$ = $(a^2 - b^2 - ab) : (c^2 - d^2 - cd)$

Given :
$$\frac{a}{b} = \frac{c}{d} = k$$
 (let)
 $\Rightarrow a = bk$ and $c = dk$

Now, find the values of L.H.S. and R.H.S. of the required result by substituting a = bk and c = dk; and show L.H.S. = R.H.S.

- 14. Find two numbers such that the mean proportional between them is 12 and the third proportional to them is 96.
- 15. Find the third proportional to $\frac{x}{y} + \frac{y}{x}$ and $\sqrt{x^2 + y^2}$

16. If
$$p: q = r : s$$
; then show that :
 $mp + nq : q = mr + ns : s$.

$$\frac{p}{q} = \frac{r}{s} \Rightarrow \frac{mp}{q} = \frac{mr}{s}$$
$$\Rightarrow \frac{mp}{q} + n = \frac{mr}{s} + n \text{ and so on.}$$

- 17. If p + r = mq and $\frac{1}{q} + \frac{1}{s} = \frac{m}{r}$; then prove that : p : q = r : s.
- 18. If $\frac{a}{b} = \frac{c}{d}$, prove that each of the given ratio is equal to :

(i)
$$\frac{5a+4c}{5b+4d}$$
 (ii) $\frac{13a-8c}{13b-8d}$
(iii) $\sqrt{\frac{3a^2-10c^2}{3b^2-10d^2}}$ (iv) $\left(\frac{8a^3+15c^3}{8b^3+15d^3}\right)^{\frac{1}{3}}$

19. If a, b, c and d are in proportion, prove that:

(i)
$$\frac{13a + 17b}{13c + 17d} = \sqrt{\frac{2ma^2 - 3nb^2}{2mc^2 - 3nd^2}}$$

(ii) $\sqrt{\frac{4a^2 + 9b^2}{4c^2 + 9d^2}} = \left(\frac{xa^3 - 5yb^3}{xc^3 - 5yd^3}\right)^{\frac{1}{3}}$

20. If
$$\frac{x}{a} = \frac{y}{b} = \frac{z}{c}$$
, prove that :
$$\frac{2x^3 - 3y^3 + 4z^3}{2a^3 - 3b^3 + 4c^3} = \left(\frac{2x - 3y + 4z}{2a - 3b + 4c}\right)^3$$

7.8 Some Important Properties of Proportion :

If four quantities a, b, c and d form a proportion

i.e. if a : b :: c : d, many other proportions may be obtained using the properties of fractions. Some of these proportions are given below :

92

1. Invertendo :

According to this property of proportions :

If a: b = c: d, then b: a = d: c.

 $a:b=c:d \Rightarrow \frac{a}{b}=\frac{c}{d}$ Proof : $\Rightarrow \frac{b}{a} = \frac{d}{c}$ \Rightarrow b:a=d:c.

[Taking reciprocal of both the sides]

2. Alternendo :

According to this property of proportions : If a : b = c : d, then a : c = b : d.

Proof:
$$a: b = c: d \implies \frac{a}{b} = \frac{c}{d}$$

 $\Rightarrow a \times d = b \times c$ [By cross-multiplication]
 $\Rightarrow \frac{a}{c} = \frac{b}{d} \implies a: c = b: d.$

3. Componendo :

If a: b = c: d, then a + b: b = c + d: d.

 $a:b=c:d \implies \frac{a}{b}=\frac{c}{d}$ Proof : $\Rightarrow \frac{a}{b}+1 = \frac{c}{d}+1$ $\Rightarrow \quad \frac{a+b}{b} = \frac{c+d}{d}$ \Rightarrow a+b:b=c+d:d

[Adding 1 on each side]

4. Dividendo :

If a: b = c: d, then a - b: b = c - d: d.

Proof:
$$a: b = c: d \implies \frac{a}{b} = \frac{c}{d}$$

 $\Rightarrow \frac{a}{b} - 1 = \frac{c}{d} - 1$ [Subtracting 1 from
 $\Rightarrow \frac{a-b}{b} = \frac{c-d}{d}$
 $\Rightarrow a-b: b = c-d: d.$

5. Componendo and Dividendo :

If a: b = c: d, then a + b: a - b = c + d: c - d. By componendo, $a: b = c: d \implies a + b: b = c + d: d$ $\frac{a+b}{b} = \frac{c+d}{d}$

=

.....I

each side]

By divid	endo, $a: b = c: d \implies$	$\frac{a-b}{b} = \frac{c-d}{d} \qquad \dots II$
Dividi	ng I by II, we get :	$\frac{a+b}{a-b} = \frac{c+d}{c-d}$
Thus,	$a:b=c:d \Rightarrow a+b:$	a-b = c+d: c-d.
Thus; $\frac{a}{b} =$	$\frac{c}{d} \Rightarrow$ (i) $\frac{b}{a} = \frac{d}{c}$	By Invertendo
	(ii) $\frac{a}{c} = \frac{b}{d}$	By Alternendo
	(iii) $\frac{a+b}{b} = \frac{c+a}{d}$	By Componendo
	(iv) $\frac{a-b}{b} = \frac{c-d}{d}$	d By Dividendo
	(v) $\frac{a+b}{a-b} = \frac{c+c}{c-a}$	$\frac{d}{d}$ By Componendo and Dividendo

12

Direct Applications :

24 If
$$\frac{8x+13y}{8x-13y} = \frac{9}{7}$$
, find $x: y$.

Solution :

Applying componendo and dividendo :

$$\frac{8x+13y}{8x-13y} = \frac{9}{7} \text{ gives } \frac{8x+13y+8x-13y}{8x+13y-8x+13y} = \frac{9+7}{9-7}$$

i.e. $\frac{16x}{26y} = \frac{16}{2} \implies \frac{x}{y} = \frac{16}{2} \times \frac{26}{16} = \frac{13}{1}$ *i.e.* $x : y = 13 : 1$ Ans.

Alternative method :

$$\frac{8x + 13y}{8x - 13y} = \frac{9}{7} \implies 72x - 117y = 56x + 91y$$
$$\implies 16x = 208y$$
$$\implies \frac{x}{y} = \frac{208}{16} = \frac{13}{1} \quad i.e. \quad x : y = 13 : 1 \qquad \text{Ans.}$$

25 If a : b = c : d, show that : 3a + 2b : 3a - 2b = 3c + 2d : 3c - 2d.

Solution :

$$a:b=c:d \implies \frac{a}{b}=\frac{c}{d}$$

 $\Rightarrow \frac{3a}{2b} = \frac{3c}{2d} \qquad [Multiplying each side by \frac{3}{2}]$ $\Rightarrow \frac{3a+2b}{3a-2b} = \frac{3c+2d}{3c-2d} \qquad [By componendo and dividendo]$ $\Rightarrow 3a+2b: 3a-2b = 3c+2d: 3c-2d \qquad Ans.$

Alternative method :

$$a: b = c: d \implies \frac{a}{b} = \frac{c}{d} = k \text{ (let)}$$

$$\Rightarrow a = bk \text{ and } c = dk$$

$$\therefore 3a + 2b: 3a - 2b = \frac{3a + 2b}{3a - 2b} = \frac{3bk + 2b}{3bk - 2b} \quad [\text{As } a = bk]$$

$$= \frac{b(3k + 2)}{b(3k - 2)} = \frac{3k + 2}{3k - 2} \quad \dots \text{I}$$

and
$$3c + 2d$$
: $3c - 2d = \frac{3c + 2d}{3c - 2d} = \frac{3dk + 2d}{3dk - 2d}$ [As $c = dk$]

$$=\frac{d(3k+2)}{d(3k-2)} = \frac{3k+2}{3k-2} \qquad \dots \Pi$$

From I and II, we get :

$$3a + 2b : 3a - 2b = 3c + 2d : 3c - 2d$$
 Ans.

26 If $\frac{8a-5b}{8c-5d} = \frac{8a+5b}{8c+5d}$, prove that $\frac{a}{b} = \frac{c}{d}$. [2008]

Solution :

Given :
$$\frac{8a-5b}{8c-5d} = \frac{8a+5b}{8c+5d}$$

 $\Rightarrow \frac{8a-5b}{8a+5b} = \frac{8c-5d}{8c+5d}$ [Applying alternendo]
 $\Rightarrow \frac{8a-5b+8a+5b}{8a-5b-8a-5b} = \frac{8c-5d+8c+5d}{8c-5d-8c-5d}$ [Applying componendo and dividendo]
 $\Rightarrow \frac{16a}{-10b} = \frac{16c}{-10d}$
 $\Rightarrow \frac{a}{b} = \frac{c}{d}$
Hence Proved.

95

Solution :

1

$$p = \frac{4xy}{x+y} \Rightarrow \frac{P}{2x} = \frac{2y}{x+y}$$
 [Now apply componendo and dividendo]

$$\Rightarrow \frac{p+2x}{p-2x} = \frac{2y+x+y}{2y-x-y} = \frac{x+3y}{y-x}$$

Again, $p = \frac{4xy}{x+y} \Rightarrow \frac{P}{2y} = \frac{2x}{x+y}$ [Now apply componendo and dividendo]

$$\Rightarrow \frac{p+2y}{p-2y} = \frac{2x+x+y}{2x-x-y} = \frac{3x+y}{x-y}$$
$$\therefore \frac{p+2x}{p-2x} + \frac{p+2y}{p-2y} = \frac{x+3y}{y-x} + \frac{3x+y}{x-y}$$

 $= \frac{x+3y}{y-x} - \frac{3x+y}{y-x} = \frac{x+3y-3x-y}{y-x} = 2$ Ans.

Alternative method :

$$\frac{p+2x}{p-2x} + \frac{p+2y}{p-2y} = \frac{\frac{4xy}{x+y}+2x}{\frac{4xy}{x+y}-2x} + \frac{\frac{4xy}{x+y}+2y}{\frac{4xy}{x+y}-2y}$$
$$= \frac{4xy+2x(x+y)}{4xy-2x(x+y)} + \frac{4xy+2y(x+y)}{4xy-2y(x+y)}$$
$$= \frac{4xy+2x^2+2xy}{4xy-2x^2-2xy} + \frac{4xy+2xy+2y^2}{4xy-2xy-2y^2}$$
$$= \frac{6xy+2x^2}{2xy-2x^2} + \frac{6xy+2y^2}{2xy-2y^2}$$
$$= \frac{2x(3y+x)}{2x(y-x)} + \frac{2y(3x+y)}{2y(x-y)}$$
$$= \frac{3y+x}{y-x} - \frac{3x+y}{y-x} \qquad \left[\because \frac{3x+y}{x-y} = -\frac{3x+y}{y-x}\right]$$
$$= \frac{3y+x-3x-y}{y-x} = \frac{2y-2x}{y-x} = \frac{2(y-x)}{y-x} = 2$$
 Ans.

28 If
$$a : b = c : d$$
; prove that :
 $(a^2 + ac + c^2) : (a^2 - ac + c^2) = (b^2 + bd + d^2) : (b^2 - bd + d^2)$

Solution :

$$a: b = c: d \implies \frac{a}{b} = \frac{c}{d} = k \text{ (say)} \implies a = bk \text{ and } c = dk$$

$$\therefore \quad (a^2 + ac + c^2): (a^2 - ac + c^2) = \frac{a^2 + ac + c^2}{a^2 - ac + c^2}$$

$$= \frac{b^2 k^2 + (b k)(d k) + d^2 k^2}{b^2 k^2 - (b k)(d k) + d^2 k^2} [\because a = bk \text{ and } c = dk]$$

$$= \frac{k^2 (b^2 + bd + d^2)}{k^2 (b^2 - bd + d^2)}$$

$$= (b^2 + bd + d^2) : (b^2 - bd + d^2)$$

Hence Proved.

29 If x, y and z are in continued proportion, prove that :

$$x^2 - y^2 : x^2 + y^2 = x - z : x + z.$$

Solution :

...

x, y and z are in continued proportion

$$\Rightarrow \quad \frac{x}{y} = \frac{y}{z} = k \text{ (say)} \quad \Rightarrow \quad x = yk, \ y = zk \text{ and } x = yk = (zk) \ k = zk^2$$

$$x^{2} - y^{2} : x^{2} + y^{2} = \frac{x^{2} - y^{2}}{x^{2} + y^{2}} = \frac{y^{2}k^{2} - y^{2}}{y^{2}k^{2} + y^{2}} \quad [\because x = yk]$$

$$=\frac{y^2(k^2-1)}{y^2(k^2+1)}=\frac{k^2-1}{k^2+1}\qquad \dots I$$

Also,
$$x - z : x + z = \frac{x - z}{x + z} = \frac{zk^2 - z}{zk^2 + z}$$
 [:: $x = zk^2$]

$$= \frac{z (k^2 - 1)}{z (k^2 + 1)} = \frac{k^2 - 1}{k^2 + 1} \qquad \dots II$$

From I and II, we get :

$$x^2 - y^2 : x^2 + y^2 = x - z : x + z$$

Hence Proved.

Alternative method :

x, y and z are in continued proportion $\Rightarrow \frac{x}{y} = \frac{y}{z} \Rightarrow y^2 = xz$. $\therefore x^2 - y^2 : x^2 + y^2 = \frac{x^2 - y^2}{x^2 + y^2} = \frac{x^2 - xz}{x^2 + xz}$ [$\because y^2 = xz$]

$$= \frac{x(x-z)}{x(x+z)} = \frac{x-z}{x+z} = x-z : x+z$$
 Hence Proved.

30 Using the properties of proportion, solve the following equation for x :

$$\frac{x^3 + 3x}{3x^2 + 1} = \frac{341}{91}$$

Solution :

Applying componendo and dividendo, we get :

$$\frac{x^3 + 3x + 3x^2 + 1}{x^3 + 3x - 3x^2 - 1} = \frac{341 + 91}{341 - 91}$$
97

$$\Rightarrow \qquad \frac{(x+1)^3}{(x-1)^3} = \frac{432}{250} = \frac{216}{125} = \left(\frac{6}{5}\right)^3$$
$$\Rightarrow \qquad \frac{x+1}{x-1} = \frac{6}{5}$$

Again, applying componendo and dividendo, we get :

$$\frac{x+1+x-1}{x+1-x+1} = \frac{6+5}{6-5} \quad i.e. \quad \frac{2x}{2} = \frac{11}{1} \implies x = 11$$
 Ans.

3) If
$$x = \frac{\sqrt{3a+2b} + \sqrt{3a-2b}}{\sqrt{3a+2b} - \sqrt{3a-2b}}$$
, prove that : $bx^2 - 3ax + b = 0$

Solution :

1

Given:

$$\frac{x}{1} = \frac{\sqrt{3a+2b} + \sqrt{3a-2b}}{\sqrt{3a+2b} - \sqrt{3a-2b}}$$

$$\Rightarrow \qquad \frac{x+1}{x-1} = \frac{\sqrt{3a+2b} + \sqrt{3a-2b} + \sqrt{3a+2b} - \sqrt{3a-2b}}{\sqrt{3a+2b} + \sqrt{3a-2b} - \sqrt{3a+2b} + \sqrt{3a-2b}}$$

[Applying componendo and dividendo]

$$\Rightarrow \frac{x+1}{x-1} = \frac{2\sqrt{3a+2b}}{2\sqrt{3a-2b}}$$

$$\Rightarrow \frac{x+1}{x-1} = \frac{\sqrt{3a+2b}}{\sqrt{3a-2b}}$$

$$\Rightarrow \frac{x^2+2x+1}{x^2-2x+1} = \frac{3a+2b}{3a-2b} \qquad [Squaring both the sides]$$

$$\Rightarrow \frac{x^2+2x+1+x^2-2x+1}{x^2+2x+1-x^2+2x-1} = \frac{3a+2b+3a-2b}{3a+2b-3a+2b} \qquad [By componendo and dividendo]$$

$$\Rightarrow \frac{2(x^2+1)}{4x} = \frac{6a}{4b}$$

$$\Rightarrow \frac{x^2+1}{2x} = \frac{3a}{2b} \quad i.e., \ 2bx^2+2b = 6ax$$

Alternative method :

$$x = \frac{\sqrt{3a+2b} + \sqrt{3a-2b}}{\sqrt{3a+2b} - \sqrt{3a-2b}}$$

$$x = \frac{\sqrt{3a+2b} + \sqrt{3a-2b}}{\sqrt{3a+2b} - \sqrt{3a-2b}} \times \frac{\sqrt{3a+2b} + \sqrt{3a-2b}}{\sqrt{3a+2b} + \sqrt{3a-2b}}$$

$$= \frac{3a+2b+3a-2b+2\sqrt{(3a+2b)(3a-2b)}}{3a+2b-3a+2b}$$

$$= \frac{6a+2\sqrt{9a^2-4b^2}}{4b} = \frac{3a+\sqrt{9a^2-4b^2}}{2b}$$

98

 \Rightarrow

Given :

$$\Rightarrow 2bx = 3a + \sqrt{9}a^2 - 4b^2$$

$$\Rightarrow 2bx - 3a = \sqrt{9a^2 - 4b^2}$$

$$\Rightarrow 4b^2x^2 + 9a^2 - 12abx = 9a^2 - 4b^2$$

$$\Rightarrow 4b^2x^2 + 9a^2 - 12abx = 9a^2 - 4b^2$$

$$\Rightarrow 4b^2x^2 - 12abx + 4b^2 = 0 \Rightarrow bx^2 - 3ax + b = 0$$
Hence Proved.
(EXERCISE 7(C)
1. If $a : b = c : d$, prove that :
(i) $5a + 7b : 5a - 7b = 5c + 7d : 5c - 7d$.
(ii) $(9a + 13b) (9c - 13d)$

$$= (9c + 13d) (9a - 13b).$$
(iii) $xa + yb : xc + yd = b : d$
2. If $a : b = c : d$, prove that :
(i6a + 7b) $(3c - 4d) = (6c + 7d) (3a - 4b).$
(a) c
(b) If $(a^2 + b^2) (x^2 + y^2) = (ax + by)^2$;
prove that : $\frac{a}{x} = \frac{b}{y}$.
(b) If a, b and c are in continued proportion,

3. Given,
$$\frac{a}{b} = \frac{c}{d}$$
, prove that :
 $\frac{3a-5b}{3a+5b} = \frac{3c-5d}{3c+5d}$ [2000]

4. If $\frac{5x+6y}{5u+6v} = \frac{5x-6y}{5u-6v}$; then prove that x: y = u: v.

2

2.

- 5. If (7a + 8b) (7c 8d)= (7a - 8b) (7c + 8d);prove that a:b=c:d.
- 6. (i) If $x = \frac{6ab}{a+b}$, find the value of : $\frac{x+3a}{x-3a}+\frac{x+3b}{x-3b}.$ 4√6

(ii) If
$$a = \frac{1}{\sqrt{2} + \sqrt{3}}$$
, find the value of :
 $a + 2\sqrt{2} + a + 2\sqrt{3}$

7. If
$$(a + b + c + d) (a - b - c + d)$$

= $(a + b - c - d) (a - b + c - d)$
prove that $a \cdot b = c \cdot d$

 $a-2\sqrt{3}$

 $a-2\sqrt{2}$

prove that :

(i)
$$\frac{a^2 + ab + b^2}{b^2 + bc + c^2} = \frac{a}{c}$$

(ii) $\frac{a^2 + b^2 + c^2}{(a + b + c)^2} = \frac{a - b + c}{a + b + c}$

11. Using properties of proportion, solve for x:

(i)
$$\frac{\sqrt{x+5} + \sqrt{x-16}}{\sqrt{x+5} - \sqrt{x-16}} = \frac{7}{3}$$
.
(ii) $\frac{\sqrt{x+1} + \sqrt{x-1}}{\sqrt{x+1} - \sqrt{x-1}} = \frac{4x-1}{2}$

(iii)
$$\frac{3x + \sqrt{9x^2 - 5}}{3x - \sqrt{9x^2 - 5}} = 5.$$

12. If
$$x = \frac{\sqrt{a+3b} + \sqrt{a-3b}}{\sqrt{a+3b} - \sqrt{a-3b}}$$
, prove that :
 $3bx^2 - 2ax + 3b = 0.$ [2007]

13. Using the properties of proportion, solve for

x, given
$$\frac{x^4+1}{2x^2} = \frac{17}{8}$$
. [2013]

14. If $x = \frac{\sqrt{m+n} + \sqrt{m-n}}{\sqrt{m+n} - \sqrt{m-n}}$, express *n* in terms of *x* and *m*.

15. If $\frac{x^3 + 3xy^2}{3x^2y + y^3} = \frac{m^3 + 3mn^2}{3m^2n + n^3}$, show that : nx = my.

EXERCISE 7(D)

- 1. If a:b=3:5, find : (10a + 3b) : (5a + 2b)
- 2. If 5x + 6y : 8x + 5y = 8 : 9, find : x : y.
- 3. If (3x 4y) : (2x 3y)= (5x - 6y) : (4x - 5y), find : x : y.
- 4. Find the :
 - (i) duplicate ratio of $2\sqrt{2}$: $3\sqrt{5}$
 - (ii) triplicate ratio of 2a : 3b,
 - (iii) sub-duplicate ratio of $9x^2a^4$: $25y^6b^2$
 - (iv) sub-triplicate ratio of 216 : 343
 - (v) reciprocal ratio of 3:5
 - (vi) ratio compounded of the duplicate ratio of 5 : 6, the reciprocal ratio of 25 : 42 and the sub-duplicate ratio of 36 : 49.
- 5. Find the value of x, if :
 - (i) (2x + 3) : (5x 38) is the duplicate ratio of $\sqrt{5} : \sqrt{6}$.
 - (ii) (2x + 1): (3x + 13) is the sub-duplicate ratio of 9 : 25.
 - (iii) (3x 7) : (4x + 3) is the sub-triplicate ratio of 8 : 27.
- 6. What quantity must be added to each term of the ratio x : y so that it may become equal to c : d ?
- 7. A woman reduces her weight in the ratio 7 : 5. What does her weight become if originally it was 84 kg ?
- 8. If $15(2x^2 y^2) = 7xy$, find x : y; if x and y both are positive.
- 9. Find the :
 - (i) fourth proportional to 2xy, x^2 and y^2 .
 - (ii) third proportional to $a^2 b^2$ and a + b.
 - (iii) mean proportion to (x y) and $(x^3 x^2y)$
- 10. Find two numbers such that the mean proportional between them is 14 and third proportional to them is 112.

- 11. If x and y be unequal and x : y is the duplicate ratio of x + z and y + z, prove that z is mean proportional between x and y.
- 12. If q is the mean proportional between p and

r, prove that :
$$\frac{p^3 + q^3 + r^3}{p^2 q^2 r^2} = \frac{1}{p^3} + \frac{1}{q^3} + \frac{1}{r^3}$$

- 13. If a, b and c are in continued proportion, prove that : $a : c = (a^2 + b^2) : (b^2 + c^2)$.
- 14. If $x = \frac{2ab}{a+b}$, find the value of $:\frac{x+a}{x-a} + \frac{x+b}{x-b}$.
- 15. If (4a + 9b) (4c 9d) = (4a 9b) (4c + 9d), prove that : a : b = c : d.

16. If
$$\frac{a}{b} = \frac{c}{d}$$
, show that :
 $(a + b) : (c + d) = \sqrt{a^2 + b^2} : \sqrt{c^2 + d^2}$

17. If
$$\frac{x}{a} = \frac{y}{b} = \frac{z}{c}$$
, prove that :
 $\frac{ax - by}{(a+b)(x-y)} + \frac{by - cz}{(b+c)(y-z)} + \frac{cz - ax}{(c+a)(z-x)} = 3$

- 18. There are 36 members in a student council in a school and the ratio of the number of boys to the number of girls is 3 : 1. How many more girls should be added to the council so that the ratio of number of boys to the number of girls may be 9 : 5 ?
- 19. If 7x 15y = 4x + y, find the value of x : y. Hence, use componendo and dividendo to find the values of :

(i)
$$\frac{9x + 5y}{9x - 5y}$$
 (ii) $\frac{3x^2 + 2y^2}{3x^2 - 2y^2}$

20. If $\frac{4m+3n}{4m-3n} = \frac{7}{4}$, use properties of proportion to find :

(i)
$$m:n$$
 (ii) $\frac{2m^2-11n^2}{2m^2+11n^2}$.

21. If x, y, z are in continued proportion, prove

that :
$$\frac{(x + y)^2}{(y + z)^2} = \frac{x}{z}$$
. [2010]

22. Given
$$x = \frac{\sqrt{a^2 + b^2} + \sqrt{a^2 - b^2}}{\sqrt{a^2 + b^2} - \sqrt{a^2 - b^2}}$$
.

Use componendo and dividendo to prove that :

$$b^2 = \frac{2a^2x}{x^2 + 1} \,. \tag{2010}$$

23. If
$$\frac{x^2 + y^2}{x^2 - y^2} = 2\frac{1}{8}$$
, find :
(i) $\frac{x}{y}$ (ii) $\frac{x^3 + y^3}{x^3 - y^3}$ [2014]

24. Using componendo and dividendo, find the value of x:

$$\frac{\sqrt{3x+4}+\sqrt{3x-5}}{\sqrt{3x+4}-\sqrt{3x-5}} = 9.$$
 [2011]

25. If $x = \frac{\sqrt{a+1} + \sqrt{a-1}}{\sqrt{a+1} - \sqrt{a-1}}$, using properties of proportion show that :

$$x^2 - 2ax + 1 = 0.$$
 [2012]

26. Given
$$\frac{x^3 + 12x}{6x^2 + 8} = \frac{y^3 + 27y}{9y^2 + 27}$$
. Using

componendo and dividendo, find x : y.

...
